Portfolio: kasparovabi.github.io · GitHub · LinkedIn

I build and operate AI tools that solve day-to-day business problems. Since 2023, I have independently developed internal platforms for Türkiye Maarif Vakfı, from defining the need with users to implementation, deployment and maintenance. My earlier work in photography and communications informs how I turn a brief into a working product.

EXPERIENCE

AI Solutions Engineer (Consultant) Apr 2023 to present
Türkiye Maarif Vakfı · Istanbul

Built eleven internal platforms for the Directorate of Communications at a foundation operating schools in 66 countries. Sole developer across product design, implementation, testing and deployment. Operate four production services and nineteen scheduled jobs, with output checks and tested recovery paths.

SELECTED RESULTS

Reliable information pipelines. Identified 48 failing endpoints among 109 sources in a pipeline that reported success. Separating failed requests from empty results raised the source response rate from 58% to 99%.

Local AI on consumer hardware. Quantized a 37 GB video model to run within 12 GB of VRAM on a 16 GB GPU. Measured 35% faster execution than bf16, with file integrity checks for model downloads.

Coordinated security disclosure. Reported seventeen findings to a hardware vendor, including a CVSS 10.0 issue with an assigned GitHub Security Advisory. Published disclosure timelines and tracked remediation. View research.

SELECTED WORK

DSH Studio. Independently built a native client for coding agents on macOS, iOS and Windows. Supports streaming output, approvals, background jobs and model switching.

Sift. Built a session inspection tool and fixed a shell command injection in its resume path.
